

Harmonize™

Why choose Harmonize?

Harmonize performs in all three critical areas: aesthetics, handleability and strength. This makes it a perfect composite for both anterior and posterior restorations.

Beautiful aesthetics, important for anterior work

Harmonize's filler network reflects light in the same way that human enamel does. The result is a true chameleon effect that enables

better blending and very natural looking restorations. It also has better polishability and gloss retention compared to leading composites on the market.

Easy to handle

Harmonize uses 'Adaptive Response Technology', meaning it is infused with a patented rheological additive that enables very quick and easy sculpting with no slumping and no stickiness. **If you use SonicFill (which also uses ART) you will love Harmonize!**

Strong, crucial for posterior work

Harmonize's filler network is very highly filled with Silica and Zirconia (81%), making it exceptionally strong and resistant to chipping and fracture. It also has very low shrinkage (1.9%)
